

Nicolet® VikingQuest™

An efficient and reliable
portable EMG solution

A diagnostic tool with technology
that delivers actionable intelligence

An Electromyogram (EMG), a test used to record the electrical activity of muscles, is frequently performed when patients have unexplained muscle weakness and includes needle EMG and nerve conduction studies. These tests function as important diagnostic tools and provide vital information about the condition of a patient's nerves and muscles. They can also detect some causes of problems such as muscle weakness, numbness, spasms, paralysis or pain. They also determine if the problem involves the nerves, muscles, spinal cord or brain. In addition, EMG exams can be used to isolate the level of nerve irritation or injury.

For years, the VikingQuest, a reliable and efficient system, has proven to be the most widely used and trusted system in the field of electromyography. Simple to operate, it provides functionality and connectivity to existing systems and is a perfect extension to any clinical practice.
